Emergency calls only android

You'll see a message on your phone's screen that it's only an emergency call, and you're wondering why? This post covers the general thing that causes this message to appear on your phone and make normal calls.1 Did you pay your bill? How long have you paid for a wireless carrier? In this case, your carrier may have turned off the service. Pay the wireless fee and see if your phone should get back to normal rather quickly.2. Is the SIM card sitting properly? If your SIM card isn't inserted or you're not sitting properly, your phone can only call 911. Make sure the SIM card is securely inserted into the slot. Removing it and sitting it back down may not hurt. The SIM card is very small. It is usually about the size of a nail and is somewhere near the battery or in an ejectable slot on the side. If you don't know where the SIM card is on your device, find the documentation for your device. If there is a defect, you can also try a different SIM card. You must be able to get a replacement SIM card for free from your wireless carrier. Note: Not all devices use SIM cards, but nowadays most devices use SIM cards.3. Have you restarted your phone? If you haven't tried to power your phone yet, so be it. Turn it off and let it sit for a few seconds before turning it back on.4. Is there a service outage? Sometimes there's a problem with your carrier's network that prevents your phone from working properly. In some cases, your phone will display an emergency call-only message by default.5 Are you getting the appropriate signal? In rare cases, if you can't connect to a wireless tower on your network, your phone might only show emergency calls. It is connected to a tower that is not part of the wireless carrier network, allowing for emergency calls. You can check if you have settings to make calls while roaming. This allows your wireless carrier to charge you more for calls.6. Last Resort - You can try all of the items above the factory reset and try to reset your device if the emergency call message still appears. Factory reset will wipe all data from your phone's memory. Therefore, before you proceed with this option, make sure that all data is backed up. If you're not sure how to reset your phone, find documentation for a specific device or do a Google search for that item. Emergency Calls If you see a message on the screen of your phone that it is only an emergency call, you will not be able to start a normal call other than the 911 call by default. Here are some reasons why certain messages interfere with your ability to make phone calls: 1. Are subscription payments up-to-date? Do you have payments for wireless carriers to date? Otherwise, your carrier may have turned off the service. Make sure your carrier subscription payments are not in arrears so that your phone is returned. Normal operation works somewhat quickly. 2. Is the SIM card inserted correctly? Have you recently removed and re-inserted the SIM card for any purpose? If the SIM card is not inserted or seated properly, there is a risk that the phone call will only be accepted with 911. Make sure the SIM card is securely inserted into the slot. Removing it and sitting it back down may not hurt. Make sure you have the right side. SIM cards, micros and nanos are all very small. They usually start to get smaller in size and about the size of a nail located somewhere near the battery or on the discharge tray on the side. If you don't know where your SIM card is on your device, check the User's Guide manual for information. If your card is defective, you can also try a different SIM card. Contact your wireless carrier to request a replacement SIM card for free. 3. Is there a service outage? Sometimes there may be a problem with a carrier network that prevents mobile phones on the network from functioning properly. In some cases, only emergency calls are displayed on the phone by default. 4. Have you restarted the phone? If all the above troubleshooting tips don't fix the problem, turn your phone on. Turn it off completely. Simply don't restart. Turn it off, remove the battery, insert the battery back into place, and leave it sitting for a few seconds before turning the phone back on. 5. Last Resort - Factory Reset If you tried all the above solutions to no avail and emergency call manmessage still persists, you may want to try factory reset your device. Factory reset will wipe all data from your phone's memory. Therefore, before you proceed with this option, make sure that all data is backed up. 6. Bring your phone to the carrier outlet and the carrier representative at the kiosk or retail point will do the same exercise just in case. If you can't fix the problem, you're going to need service over the phone. One of the most common issues android users deal with is not being able to make calls just by emergency calls or use other network-based features of the handset. Technically speaking, you can't use some basic features and this can be very frustrating. However, as with other common problems with Android smartphones, there are some fixes that you can apply regardless of your phone. Put together a complete guide with a solution that can be applied if your phone says emergency phone only, suitable for all Android running handsets. Let's see how you can get rid of this problem, without much more ado! Make sure your subscription payments are up to date Some users sometimes completely forget to pay their bills and their carrier disconnects from the network. Basically, in this case, it's not a technical issue, as the phone runs smoothly. Make sure you've paid for your subscription before considering a potential fix. If not, do it immediately, and then send your carrier Quickly reconnect and instantly use the phone at full capacity. If you don't mind your subscription, you can try connecting to the network manually. In some cases, your carrier changes some settings to disconnect your network. I've been through this a few times and applying this tip has helped. To do this, just follow this path and go to Wireless & Network > Network > Network Operator > Settings. It may vary a bit depending on the manufacturer of your phone, but on most Android devices it's exactly like this. Here you will find a list of airlines available in your country. Select one of the uses and wait a few minutes for the phone to reconnect. This mode disables all broadcast and cell reception on the phone. Swipe down on the notification bar, activate the mode, and then deactivate it after a few seconds. Make sure your phone is connected to the network now. When you restart the phone, the simple restarted sand solves many things. Turn off your phone, leave it for a few seconds, and then turn it back on. Verify that the network is functioning properly now. Checking the location of the SIM card If the method does not work, the SIM card may be misplaced, so it will not be in perfect contact with the device, which can lead to a situation where the phone only makes an emergency call. This impact can occur after deleting your phone or handling other types of shocks. Turn it off, remove the SIM tray and make sure the card is properly placed in the slot. After this, turn on your phone and check if the network is still behaving incorrectly or not. Check your SIM for potential damage but no luck? In this case, remove the SIM card from your phone again to make sure it is in good condition. If you have been using it for several years, it may be damaged. Make sure the connectors are clean and free of dust and debris. Also, if you are using a model with a removable battery and the card slot is directly below it, check the connector on the phone itself for problems. If you find something that can affect your good function, clean the place with a soft eraser or cotton swab and rub alcohol. Also, to make sure there's nothing wrong with the SIM card itself, ask a friend with the same carrier's SIM to use the SIM on your phone and vice versa. You will be able to find out if the card or phone is to blame for this situation. Changing the network mode to GSM alone is considered outdated and slow, but 2G networks are still some of the most powerful networks available. And if your phone only says emergency phone, it could be the solution. To use it, you need to follow the path of the menu, but it depends again on the phone manufacturer. Try one of the following: Mobile Network > Network Mode Settings > Data Usage > Settings, and then tap the menu icon in the upper right corner. Select cellular network>> Preferred network type and select GSM only. Give your phone a few moments, see how many moments you are connected to the network, or continue to display the same message. Make sure that the fixed dialing function is enabled or that this feature is enabled, a special feature thatAndroid has allows you to make calls only to numbers in a specific list. This can be a problem, so it's a good thing to make sure it's enabled or not. Additional Settings > Call > Go to Settings>> Fixed Dialing Number. Here you can check if it is enabled or not. In this case, enter the PIN2 code to deactivate it, and then click OK. You may need to reboot your phone for the change to take effect. Check the status of your network, so don't ignore scenarios where your phone is talking emergency calls due to network-related issues. And the good part is that updates are posted more frequently, so you can check your carrier's website or social media account for interruptions. Services such as down detectors are available on the other side, so you can update them on some key services and the health of your network. First use a special patch: this is a fix that only works with root phones, so if your phone isn't rooted, you can skip it. We are talking about an Ariza patch that can solve the modem problem of a particular Android device. It has proven efficient on some Samsung phones, so you can give it a try. To try this solution, follow these steps:Download BusyboxMake Make sure that the option to install the application from an unknown source is checked in settings >> Security Check Ariza Patch, available from XDA developer Installation Ariza on your phone, then if the installation persists after this problem is exceeded, choose to heat it after the installation is exceeded If you are unlucky enough to set up a factory reset phone and your phone says an emergency call even after performing all these potential fixes To completely rule out software problems, you can try factory reset. Before you begin, you should fully back up your data. Otherwise, go to Backup and Reset >> Settings and wait for it to complete and sync to your Google Account. After this, go to Settings and look for the System menu, then select the Reset option, select Clear All Data (Factory Reset) scroll to the bottom of the page and look for the reset phone, then select Delete everything it selects to continue with your device's PINSelect, like in other cases, these steps may vary slightly depending on the phone. Contact the carrier, so the problem persists... Call your current carrier and explain what's going on, including every step you've made. If it's actually a hardware issue and your device is still under warranty, you can provide a replacement SIM card or a new phone. There is actually a hardware problem that is causing this, but You can no longer get a warranty and take it to the service to see if it can be fixed. In most cases, the damaged antenna causes everything, so the part can be replaced. Hopefully, you will find a solution to this phone-only problem in our guide to say this call and restart normal use. Also, if you know anything else that works in situations like this, please tell us, using the comments section below! Below!
